

Rocket® Seldinger Chest Drainage Sets & Ward Procedure Trays

The **Rocket® Seldinger Chest Drainage Kit** combines the benefits of small bore catheterisation with the ease and reliability of the Seldinger approach whether under direct vision, x-ray screening or ultrasound guidance. Small bore catheters have been shown to be as effective as larger drains without the disadvantage of patient discomfort ^{1,2}

For percutaneous insertion of a chest tube for pleural drainage of fluid and air and is particularly suitable for: ³

- Pneumothorax, spontaneous or iatrogenic
- Effusions, benign or malignant, except those with high protein content.
- Low viscosity empyema.

In response to concerns and advice from *British Thoracic Society* members, the **Rocket Seldinger Chest Drainage Set** now contains shorter (10cm) dilators with secondary safety stops. These help to minimise the risks of over-insertion associated with the traditional 20cm dilator.

The **PK** code contains drapes and a gown in response to the BTS reply to the NPSA report NPSA/2008/RRR3
